

## Whole Exome Sequencing

### Gene package Skeletal Dysplasia, Version 2, 30-9-2019

#### Technical information

DNA was enriched using Agilent SureSelect Clinical Research Exome V2 capture and paired-end sequenced on the Illumina platform (outsourced). The aim is to obtain 8.1 Giga base pairs per exome with a mapped fraction of 0.99. The average coverage of the exome is ~50x. Duplicate reads are excluded. Data are demultiplexed with bcl2fastq Conversion Software from Illumina. Reads are mapped to the genome using the BWA-MEM algorithm (reference: <http://bio-bwa.sourceforge.net/>). Variant detection is performed by the Genome Analysis Toolkit HaplotypeCaller (reference: <http://www.broadinstitute.org/gatk/>). The detected variants are filtered and annotated with Cartagenia software and classified with Alamut Visual. It is not excluded that pathogenic mutations are being missed using this technology. At this moment, there is not enough information about the sensitivity of this technique with respect to the detection of deletions and duplications of more than 5 nucleotides and of somatic mosaic mutations (all types of sequence changes).

- Gene symbols according HGNC

- OMIM release used: 8-9-2019

| HGNC approved<br>gene symbol | Phenotype description including OMIM phenotype ID(s) | OMIM<br>gene ID | median depth | % covered<br>>10x | % covered<br>>20x | % covered<br>>30x |
|------------------------------|--|-----------------|--------------|-------------------|-------------------|-------------------|
|------------------------------|--|-----------------|--------------|-------------------|-------------------|-------------------|

- "No OMIM phenotypes" indicates a gene without a current OMIM association
- OMIM phenotypes between "[ ]", indicate "nondiseases," mainly genetic variations that lead to apparently abnormal laboratory test values
- OMIM phenotypes between "{}", indicate risk factors
- OMIM phenotypes with a question mark, "?", before the disease name indicates an unconfirmed or possibly spurious mapping
- The statistics above are based on a set of 100 samples
- Median depth is the median of the mean sequence depth over the protein coding exons ( $\pm 10$ bp flanking introns) of the longest transcript
- % Covered 10x, 20x and 30x describes the percentage of a gene's coding sequence ( $\pm 10$ bp flanking introns) that is covered at least 10x, 20x or
